Architecture In AutoCAD Architectural Edition, 3D views are displayed in the form of buildings or complex structures. Additional 3D views such as Site or Horizontal or floorplans are displayed in 2D. In these views, AutoCAD Architectural Edition supports the use of components called "features", which can be used to define building blocks and assemble them into buildings or other complex structures. AutoCAD Architecture includes two applications. The main application is AutoCAD Architectural, which has a user interface that makes it easier for designers to work with the software, and a command line version called AutoCAD R12 Architectural. When the mouse pointer is moved around a 3D model, it is displayed in

2D. All available 2D views can be displayed at the same time. With the three-dimensional rendering available in AutoCAD Architectural, it is possible to define and move various components (such as windows, doors, roofs, etc.) inside the 3D environment. When architects are designing 3D models of buildings, the different components (windows, doors, roofs, etc.) can be set up as 3D models or as 2D elements. This approach allows architects to create drawings that resemble the 3D models they are creating. Features can be created and edited. They are elements that can be used to model, for example, doors, windows, roofs, and other building components. Features can be created using a variety of CAD tools, including the

DesignCenter or the Draw tab in AutoCAD. Features are editable using various tools, including the Properties palette, the Manage Features window, and the DesignCenter. A feature is essentially a schematic representation of a part of a structure, typically consisting of three components: the geometry (such as a shape) the properties of the geometry (such as color, material, etc.) the attributes of the geometry (such as size, position, etc.) Features can be manipulated by moving them, setting their properties, or deforming them. They can be laid out on the screen or exported to other formats. Features are also an important component of the Modeling Process which allows the creation of new parts of a structure, or the editing and updating of existing parts. The Modeling Process is

made up of three modules: Modeling: the creation of the actual part of the structure; Remod a1d647c40b

You can send feedback to AutoCAD through the Markup Assist task pane. (video: 1:40 min.) Import and export models: Import and export using native formats, including the new native 3D format. Use this format to export your CAD models to a 3D viewer or model, or to import models into AutoCAD. (video: 5:50 min.) Import and export through native formats:

XML, CorelDRAW® MX, and many other CAD formats are now available to import and export CAD models. The new Xpress 3D format is designed for 3D. (video: 1:35 min.) Re-arrange, collapse, and rotate based on anchor points, not on viewport. Drawing tools and the drawing area now maintain their relative positions when a view is changed. This enables you to create more complex drawings with ease. (video: 1:18 min.) Allowing multiple views for a drawing: Create multiple views for your drawing for one model. This enables you to work on different aspects of your drawing at the same time. (video: 1:20 min.) Creative Layer: Show and hide specific layers based on a current tool, drawing area, or view of a drawing. Create more convenient windows for

working with specific layers. (video: 1:09 min.) Cue Layer: Show and hide specific layers based on a current drawing area or view. Create more convenient windows for working with specific layers. (video: 1:09 min.) Create a 3D drawing. When you create a 3D drawing, it's easy to view it as a 2D drawing. View your 3D drawing as a 2D drawing. The drawing area and viewports are scaled based on your 3D drawing. You can also rotate, align, and move the drawing area and viewports based on the 3D model. (video: 1:07 min.)
