Older versions Delphi Delphi was a suite of development tools from Borland for personal and commercial use. It is written using Object Pascal and is based on the concept of components. Before version 5, Delphi was a 32-bit compiler, but starting with version 6 it uses 64-bit object code and therefore requires a 64-bit version of Windows.

---

Delphi development can be done using integrated development environment (IDE) or on a stand-alone basis, using the command line compiler (DCC). Delphi supports various versioning and file sharing technologies such as Subversion and CVS. Delphi is one of the few languages to use the .NET Framework for interoperability. Delphi interfaces with an application database, such as dBASE, that can support schemas. Applications use a database of schemas for storing and retrieving information, and can use the interface to access and use the data in the database. The RAD Studio IDE was later to be released to the public for the same purpose. Delphi used the ACADO 3D animation library for the vector, curves and solids component. ACADO was later open sourced and integrated into Delphi. Freeware Called Free Pascal, Free Pascal was started by a few former Borland Pascal developers. As Free Pascal is 100% compatible with Borland Pascal (the source code is available), Borland retains control of Pascal. Unlike Delphi, Free Pascal does not support components and does not support an IDE. Instead, Free Pascal compiles to a Windows executable and requires users to use the command line. Free Pascal supports networking and the full range of Windows platforms, including Windows NT, Windows 2000, Windows XP, Windows Vista, Windows 7, Windows 8, Windows Server, Windows CE and WinPE. Free Pascal supports Unicode (UTF-8), UTF-16, and UCS-2 data types. Free Pascal supports the following versions of Windows and MS-DOS: MS-DOS 2.0 and higher Windows 3.0 or higher Windows 95 or higher Free Pascal and Delphi were developed by the Free Pascal community and freely available for a very long time, until in late 2008, Borland decided to place the development of Pascal on hold and give support to other languages for the next version of Delphi. Q: How can I generate and inject an anonymous interface with TypeScript? I'd like to make an anonymous interface: `class MyClass { constructor() { } } var MyClass: any;` But I'd like to use that anonymous interface so I can do things like this: `class MyClass { constructor() { } } var i: MyClass; // Later: i.doSomething();` I've tried adding an interface to the class, and using the new keyword to convert the anonymous type to the interface. But when I do that, the interface has no function definitions inside it: `class MyClass { constructor() { } } interface MyInterface { doSomething(): void; } class MyClass: MyInterface { constructor() { } } var i: MyClass; // Later: i.doSomething();` A: `class MyClass { constructor() { } } var i: MyClass; // Later: i.doSomething();` MyClass is not an interface, but it has members that can be implemented by an interface. In order to have the anonymous class implement an interface (without having to declare it), you need to use the `implements` keyword. This keyword is a bit of an overloaded word in TS,
