The present invention relates to multi-cylinder overhead cams for internal combustion engines and, more particularly, to an external tie bar connecting a plurality of first and second overhead camshafts, and to a method of connecting external tie bars to second intermediate overhead camshafts. Prior art engines have utilized a number of different techniques for mounting and connecting multiple camshafts to a camshaft drive source, typically a timing chain. A timing chain is a driven intermediate shaft disposed between a camshaft, driven by a timing belt or an accessory belt, and a crankshaft. In order to connect more than one camshaft to a timing chain, multiple intermediate shafts, or pins, are typically employed as shown in European Patent Application 0,371,431 A2. In the '431 application, a timing chain wraps around a hub on a first intermediate shaft located between a first camshaft and a first intermediate hub at the end of the first intermediate shaft away from the camshaft. A second, shorter intermediate shaft of smaller diameter is connected between the first camshaft and the first intermediate hub to receive the chain on the second intermediate shaft. Unlike the previous multiple intermediate shaft example, more recent cam chain layouts have incorporated a single internal cam chain drive station that is formed as an alternately positioned A-shaped bracket disposed between the camshafts. This A-shaped bracket is received on a first common intermediate shaft and includes ball bearings spaced along the length of the shaft to engage a timing chain which is driven from a second intermediate external cam to the camshaft. A more recent type of arrangement is that disclosed in U.S. patent application Ser. No. 09/592,256 filed concurrently and assigned to the assignee of the present invention, which employs external tie bars that extend laterally across the engine connecting two overhead camshafts for use with a common internal cams drive chain. In all of the previous and subsequent cam chain arrangements, it is common to have the camshafts in two distinct groups or banks, as is commonly done in two-stroke cycle engines. In some other engine arrangements, there may be a third bank

This is the first of a series of posts to highlight some of the issues with the new Divergent film. I want to start by saying that I'm a huge fan of the book, and I really enjoyed the first movie, and I will probably be seeing the second one, but there are a number of issues that I want to talk about because they have made me

question whether this is the best franchise to continue the story in the timeline of the films. First of all, I think it's fair to point out that while both movies were technically released by Summit, they were financed by Universal. Universal is the parent company of Summit and so their budget is the budget for the film, and according to Variety, Fox had to have Universal's approval to do what they wanted with the film, meaning that if they wanted to make it terrible, they could have done. And apparently they did. I feel like it has been fairly well documented that a lot of pressure was put on Fox to do a better job with the sequel than the first one, and while I'm not going to say whether or not that pressure resulted in a lesser film, it has resulted in the film not really being worth seeing unless you're completely devoted to the franchise. And Fox also paid a hefty price for this film. The movie rights to the book have been owned by Summit since before they did the first
