National Association of Energy Engineers The National Association of Energy Engineers is a professional association of engineers in the energy field. It is dedicated to the advancement of professional knowledge, the exchange of information, and the promotion of service to its members. The association and its members are dedicated to the energy industry, promoting education and maintaining professionalism. As a member of the American Institute of Mining, Metallurgical, and Petroleum Engineers, as a member of the American Society of Mechanical Engineers, as a member of the Association of Consulting Engineers, and as a member of the American Society of Civil Engineers, the National Association of Energy Engineers supports those organizations and their commitment to their member's professional stature. On May 2, 2017, the United States Department of Energy issued a challenge to the National Association of Energy Engineers to solicit innovative solutions to improve the efficiency of energy usage. The challenge will provide $300 million in prizes for solutions developed by June 2018 that could be implemented to reduce US energy use by 20%, lower US energy prices, and reduce greenhouse gas emissions. The Minnesota Study of Risk and Inheritance (MSRI) is a family study of affective disorder and personality disorder. The major focus of the study is psychopathology in the family, but other traits or features of the family may be affected as well. The study has recruited (1) high-risk probands with personality disorder and affective disorder (PD-A), (2) subclinical PD subjects, and (3) controls with no family history of disorder. These groups are being followed longitudinally. While the MSRI was initiated in the mid-1970s, recruitment and data collection are still ongoing. As with other family studies, however, the ultimate goals of the MSRI include: (1) understanding the genetic and environmental etiologies of PD and A, (2) developing a public health model of psychopathology, (3) generating hypotheses for clinical intervention, and (4) producing a better understanding of the family and psychopathology in general. Presently, the MSRI is attempting to confirm the heritability estimates of IQ, personality, affective temperaments, impulse control, and risk factors for substance abuse. This report focuses on the recruitment of the high-risk probands.Q

## What's New In?

Indoor air is a significant source of VOCs, HAPs, and bacteria in hospitals and other health care facilities. Today, health care providers are challenged to treat disease at the source and to enhance the healing and recovery potential of patients. Available therapy is often limited by either antibiotic resistance, toxicity, or a lack of effectiveness. The goal of these studies is to investigate the effects of hospital conditions on the levels of VOCs, HAPs, and bacteria inside hospital and other health care facilities. We also are interested in the effects of these factors on health care workers exposed to contaminated environments. We propose to obtain detailed information about indoor air environments in operating rooms (ORs), ambulatory care (AC) clinics, and emergency departments (EDs) in order to analyze key components in hospital environmental control systems. To identify factors controlling indoor air quality, we will use targeted and untargeted GC/MS and LC/MS analysis to measure 187 compounds from airborne bacteria, viruses, spores, fungi, VOCs, and airborne particles. We will also use low-flow, high-volume ventilation systems to establish baseline indoor air concentrations of various compounds in a variety of clinical settings and then determine how they change in clinical settings where suspected pathogens are present. Because hospital staff are a major health risk, we will analyze personal air samples to detect and quantify bacteria, viruses, fungi, spores, and the major VOCs produced by these pathogens. We will analyze hospitalized patients'medical records to obtain information about the activities performed in and around ORs, AC, and ED. We will track infectious hospital staff and equipment to see what they are bringing into the hospital and to where they are taking it after leaving the hospital. We will use this information to evaluate the effectiveness of hospital environmental control systems. We will expose healthy volunteers and staff to clean air, but also to environments contaminated with bacteria or other aerosolized agents, and we will monitor levels of bacteria, viruses, and VOCs. We will also investigate the use of surgical face masks and surgical face shields to reduce the possibility of inhaling hospital-related pathogens and other contaminants. Finally, we will investigate the effects of chemical disinfection of non-touch surfaces using aqueous solutions of quaternary ammonium compound solutions and bleach. PUBLIC HEALTH RELEVANCE: This research is designed to identify hospital conditions that lead to high levels of airborne bacteria and contaminants inside health care facilities. As a result, health care providers will be more educated about ways to control infectious airborne
