Q: How do I rename or delete "revision" entries in Git? I've got a repo with a ton of commits which I often want to work on in a totally different branch. I don't always want to merge back to master, and there are no branches in my repo that I feel I need to keep. However, I don't want to track these separate repositories in my history. In this case, I simply use git reset to make a new start in another branch. However, I have to commit, and hence git revert or git reset --soft do not work, because these simply keep the last commit within the branch, they do not move it to another branch. To make things even more complicated, when I do a new commit, I leave a "revision" entry in the log, referring to the old commit. So what do I do to get rid of these "revision" entries and let my commit history be displayed as it is supposed to be: git commit -m "Changed the code" A: There is nothing you can do about that. It's all fine and normal. The only real way to "clean" your history would be to rewrite it. Git doesn't keep a history of commits that have already been committed, so simply removing the revisions would not help at all. The only thing you can do is to either ask git not to track commits that have already been seen by users, or simply not commit them in the first place and only push when they are actually needed. If git were to remove the already committed commits, they would be merely uncommitted commits. A: It is not possible to remove the history of commits without rewriting it. You can convert those commits to loose objects using git archive and git reflog (or delete them with git gc --prune=now --aggressive) before pushing.
