Technical Field The present invention relates to a method for manufacturing a photonic crystal fiber (PCF) and a photonic crystal fiber. 2. Related Art A photonic crystal fiber (PCF) is a kind of wavelength division multiplexing (WDM) fiber with a refractive index periodically varying along the axis thereof, and can have an excellent intrinsic property such as low loss and polarization dependent loss. Furthermore, since the refractive index is modulated, a mode field diameter in the core is increased, and thus even in a small-core PCF, transmission loss is suppressed. A photonic crystal fiber (PCF) that is presently produced is a silica-based PCF made of pure silica glass. In the production method of a silica-based PCF, however, a chemical vapor deposition (CVD) apparatus is needed to produce glass of high silica purity, and there is also a problem of a high cost. Furthermore, the silica-based PCF can be used in a light source for optical fiber communication only in a short wavelength region of 1.48
