Mac.Euoplasmodium falciparum is an opportunistic human parasite that causes the most virulent form of

malaria, known as severe malaria. This disease occurs in tropical regions and is characterized by a rapid onset of clinical manifestations, which include cerebral malaria and organ failure. Mortality rates range between 20% to 80% in children and 10% to 60% in adults, depending on the ability of the host to mount protective immune responses. Therefore, the development of improved vaccines will significantly enhance global health and reduce the economic cost associated with malaria. This is of particular importance to the Congo, which is currently experiencing an epidemic of *P. falciparum* malaria, and where the cost of treatment is the highest. Our overall objective is to design novel vaccine strategies that focus on enhancing immune responses to stage-specific antigens, as a means of improving long-term protective immunity. This proposal will focus on the development of a multistage *E. falciparum* vaccine that provides protection against infection and reduces morbidity and/or mortality. In these studies c6a93da74d
